Excerpt: $(n-3)$ -way locus together with the 002 of tangent planes, viz. and so on. Each of these different classes of oo 1 elements satisfying the Pfaffian equation will be denoted by the symbol M, l ; each will form a manifold of united elements with $(n-1)$ degrees of freedom. Thus, when $n = 2$, that is, in two-dimensional space, the elements are the points with the straight lines through the points. The symbol Ml will now denote either an infinity of points on some curve together with the corresponding tangents to the curve; or a fixed point with the infinity of straight lines through the point; either of these infinities of elements will satisfy the Pfaffian equation. In three-dimensional space there are Q05 elements consisting of points with the planes through them. The symbol $M2$ will now denote one of three 002 sets of united elements, viz. (1) the points of any surface with the corresponding tangent planes; (2) the infinity of points of any curve together with an infinity of tangent planes passing through each point of this curve; (3) the 002 of planes passing through any fixed point; the elements of any one of these three sets will satisfy the Pfaffian equation 156. We must now consider Lie's definition of an integral of a partial differential equation of the first order; and we need only take the case where the equation is homogeneous, and the dependent variable does not explicitly occur; for any...
